Research Scope

My research tackles the challenges arising from the widespread deployment of distributed inverter-based resources at the grid-edge, and analyses the mechanisms through which prosumers affect the operation of the power distribution systems. It fills the gap between renewable integration and grid resilience. My pioneering approach to this topic is called *society-in-the-loop* analysis, where I bridge the heretofore separate fields of power engineering (including power systems and power electronics) with computational social science. My research projects are interdisciplinary, combining theoretical analysis of power systems dynamics, control synthesis of power electronic inverters, and modelling of prosumer behaviours.
